Professional Summary

Full stack software engineer with a strong design background, building products across React and TypeScript interfaces and Python/Django APIs. Experienced owning features from technical design through staged rollout and adoption instrumentation, with a focus on usability, reliable data handling, and subscription-tier workflows.

Work Experience

Software Engineer @ Scribe (Jun 2026 — Present)

- Owned workspace **List View** from initial scope through staged rollout and full release, adding sortable tables across document surfaces and instrumenting adoption in Mixpanel.
- Resolved enterprise customer escalations and added service alerting with Honeycomb and Terraform as part of the Docs team's on-call work.

Key Project: Consent-Based Documentation Sharing

- Led design and implementation of a workflow for turning private activity recordings into shared documentation with the owner's approval, as **sole engineer** across Django APIs and React/TypeScript interfaces.
- Proposed and implemented document creation only after approval, preventing orphaned documents from declined requests.
- Added transactional permission checks and concurrency controls for competing approval and decline actions.
- Enforced subscription-tier access rules and built an upgrade transition to resolve outstanding requests when teams move to Enterprise. Instrumented the request-to-approval funnel to measure usage and completion.

Software Engineer @ Sigma Computing (Nov 2024 — Jun 2026)

- Built single-select columns and led multi-select from prototype to general availability, including data validation and warehouse-executed column type conversions.
- Retired a data-loss-prone commit path in Go across four warehouse connectors and added Redis conflict detection to **expose silently overwritten edits**.
- Optimized data validation with batched warehouse queries, caching, and scoped React subscriptions. Added CI tests to catch unnecessary table re-renders.
- Extended Rust-based CSV ingestion to support international date formats while preserving existing interpretations of ambiguous dates.
- Primary code reviewer for the input-table and file domain, reviewing 150+ PRs from 25+ engineers across six repositories; mentored a new-grad engineer.

Key Project: File Columns & File Upload Control

- Owned frontend development of File Columns, paired with one backend engineer on upload integration, enabling file attachments in warehouse-backed tables; adopted by **71 enterprise customers** representing \$2.2M+ ARR.
- Built the File Upload Control across React/TypeScript and Node.js, extending the formula and variable systems so files could be used in forms and automated workflows.
- Extended signed-download APIs across AWS, GCP, and Azure to support file downloads with sanitized filenames.

Software Engineer @ Circolo (Jul 2023 — Nov 2024)

- Led development and design of the Remy hospitality platform's interactive menus and promotional displays.
- Automated physical-menu digitization using computer vision, replacing item-by-item manual entry.
- Built 3+ mobile-optimized PWAs using Next.js, React, and Redux, with offline support.

Education

2023 Cornell University, M.Eng. in Computer Science (**GPA: 3.82**)

2021 Cornell University, B.S. in Information Science (Minors in Computer Science & Game Design)

Technical Skills

Frontend: Next.js, React, Redux, Zustand, Stitches, TypeScript

Backend: Python, Django, Node.js, Go, SQL

DevOps & Platforms: GitHub Actions, Git, Linux, Sentry, Honeycomb, Terraform, AWS, Heroku, Cloudflare
